Basic Requisites

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

Code Compilation

- Serial version C compiler e.g. gcc
- Parallel Version MPICH library v2.0+ e.g., mpicc, mpirun, mpiexec etc.
- Python v2.7+, curses library (optional)
- (only for AMR) C++ compilers, Chombo Library & HDF5

Data Analysis and Visualization

- Python v2.7+ or v3.5+ OR Gnuplot OR IDL
- Recommended for 3D visualization and volume rendering LLNL VisiT OR Kitware Paraview

Bhargav Vaidya

Installation

Setting up a Problem in PLUTO

Compiling and Running

Visualization of Data

Features of PLUTO code

Some Examples

Downloading from the Web-page

Code Webpage : http://plutocode.ph.unito.it Unpacking and Installing the code

 Untar the .TAR.GZ file → tar -xvzf pluto-xx.tar.gz where xx is the PLUTO version → will create a folder named PLUTO.

Latest version is 4.3 (June 2018)

 Define a PLUTO_DIR in your shell → bashrc: export PLUTO_DIR =< Path to the PLUTO directory > tcsh: setenv PLUTO_DIR < Path to the PLUTO directory >

Comprehensive Documentation

The unique selling point of the code is the exhaustive documentation.

- The pdf version can be found in \$PLUTO_DIR/Doc/userguide.pdf
- Additional there is a Doxygen documentation for all the test problems and source codes.

Problem Description

• What is the underlying physics ?

 \rightarrow With or without magnetic fields ? Is the flow relativistic ?

- In what geometry do you wish to solve the equations ?
 → What are the dimensions? What are the grid extends for each of these dimensions?
- Does the problem require to add source terms?
 - \rightarrow What is the functional form of source term ? Which conservation equations are affected?
- What physical conditions would be used to prescribe boundary conditions?

 \rightarrow Does the solution requires userdef boundary conditions? How to minimize the effects of boundary where not required?

• What is the time-scale upto which the simulation should run?

An Example!

Setting up a Problem in PLUTO

- Compiling and Running
- Visualization of Data
- Features of PLUTO code
- Some Examples

Interaction of solar wind with Earth's Magneto-sphere.

- What is the underlying physics ? Non-relativistic with magnetic fields
- In what geometry do you wish to solve the equations ? 3D Cartesian $\rightarrow (x, y, z) = (20R_{\rm E}, 20R_{\rm E}, 100R_{\rm E})$, Earth is centered at (0,0,0)
- Does the problem require to add source terms? Yes \rightarrow Gravity to support Earth's magneto-sphere.
- What physical conditions would be used to prescribe boundary conditions? Injection of solar wind on left z axis and free flow in all other possible directions.
- What is the time-scale upto which the simulation should run? Till steady state is achieved.

Some Examples

Init block : Inputs -

- v[NVAR] → an array of primitive variables
- x1, x2, x3 → Point co-ordinate for the chosen geometry.
- Used to set the initial conditions in the domain point by point.

Input Files : init.c

```
void Init (double *us, double x1, double x2, double x3)
/*
double r, theta, phi, B0;
 g_gamma = g_inputParam[GAMMA];
 r = D EXPAND(x1*x1, + x2*x2, + x3*x3);
 r = sart(r):
 us[RH0] = 1.0;
 us[VX1] = 0.0:
 us[VX2] = 0.0;
 us[VX3] = 0.0:
 us[PRS] = g_inputParam[P_OUT];
 if (r <= g inputParam[RADIUS]) us[PRS] = g inputParam[P IN];
 theta = g inputParam[THETA]*CONST PI/180.0;
      =
        g_inputParam[PHI]*CONST_PI/180.0;
  nhi
      = g inputParam[BMAG];
 RØ
 us[BX1] = B0*sin(theta)*cos(phi):
 us[BX2] = B0*sin(theta)*sin(phi);
 us[BX3] = B0*cos(theta):
 #if GEOMETRY == CARTESIAN
  us[AX1] = 0.0:
  us[AX2] = us[BX3]*x1;
  us[AX3] = -us[BX2]*x1 + us[BX1]*x2;
 #elif GEOMETRY == CYLINDRICAL
  us[AX1] = us[AX2] = 0.0;
  us[AX3] = 0.5*us[BX2]*x1:
 #endif
 #if BACKGROUND FIELD == YES
  us[BX1] = us[BX2] = us[BX3] =
  us[AX1] = us[AX2] = us[AX3] = 0.0
 #endif
```

Features of PLUTO code

Some Examples

Makefile & Compilation

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

A **makefile** is created based on the architecture/compiler of your choice. Some standard combinations are available in the option of *Change Makefile* option of the setup.

>> Change makefile <<

Darwin.gcc.defs

Darwin.mpicc.defs Linux.gcc.defs Linux.mpicc.defs MARCONI.mpiicc.defs Template.defs debug.defs profile.defs

Finally, compile the code using the - **make** command in the terminal to get the executable PLUTO!

Check with Idd if all libraries are linked. Serial and Parallel run commands.

- If compiled with ${\bf gcc}$ the command to run is (Serial mode)
 - : ./pluto
- If compiled with Parallel compilers liked **mpicc**, then the command to run is : **mpiexec -n 4 ./pluto**

At the end of the run, the code writes the data in prescribed format along with **.out** and **.log** files.

The **grid.out** contains information about the grid to be read for visualization.

The **.out** files corresponding to each data-set has information on variables stored at different time.

Installation

Setting up a Problem in PLUTO

Compiling and Running

Visualization of Data

Features of PLUTO code

Some Examples

- The log files keep track of the progress of the simulations
- For parallel job, each processor writes it own log file.
- Frequency as to when the log output should written is governed by "log" input in pluto.ini

Output Files : log files

Setting up a Problem in PLUTO

Compiling and Running

Visualization of Data

Features of PLUTO code

Some Examples The code outputs in various data formats either in the *single file* format or *multiple file* format. The different usually used formats are -

- .dbl Native binary in double format. Useful for restarting the code.
- .flt Native binary float format
- .vtk Visualization Tool kit format. (Vislt visualization)
- .hdf5 Obtained for AMR run (Vislt visualization)
- .tab, .ppm Not very relevant for general runs.

Setting up a Problem in PLUTO

Compiling and Running

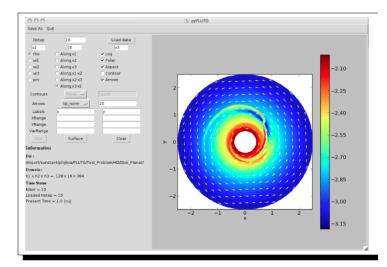

Visualization of Data

Features of PLUTO code

Some Examples

Visualization using Python Valid for all of the above mentioned data formats – Does not

support 3D visualization.

Installation

Setting up a Problem in PLUTO

Compiling and Running

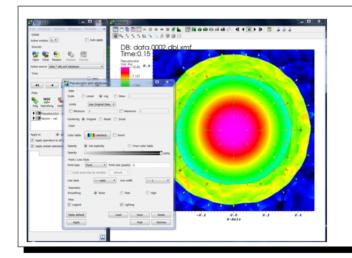

Visualization of Data

Features of PLUTO code

Some Examples

Valid for the **.vtk** and **.hdf5** data file formats – Very useful for 3D visualization.

Visualization using Visit

- Optically Thin Radiation Cooling.
- Forced Turbulence with appropriate stirring
- Ambipolar Diffusion
- Hall Effect
- Magnetic Resistivity
- Thermal Conduction
- Viscosity
- Option for working the Rotating Frame.
- Options for various EoS.

I will discuss the following -

- HD Sod Shock tube problem
- MHD Blast Wave problem
- You will have to run the following
 - Rayleigh-Taylor Instability
 - Kelvin-Helmholtz Instability
 - Study of Shock-cloud collision.
