Acta Crystallographica Section E: Structure Reports Online is the IUCr's highly popular open-access structural journal. It provides a simple and easily accessible publication mechanism for the growing number of inorganic, metal-organic and organic crystal structure determinations. The electronic submission, validation, refereeing and publication facilities of the journal ensure very rapid and high-quality publication, whilst key indicators and validation reports provide measures of structural reliability. The journal publishes over 4000 structures per year. The average publication time is less than one month.

Bis[2-(2-hydroxymethyl)pyridine- κ^2 N,O]-
(pivalato- κ O)copper(II)

M. Mobin Shaikh,* Veenu Mishra, Priti Ram and Anil Birla

Discipline of Chemistry, School of Basic Sciences, IIT Indore, Indore, Madhya Pradesh 452 017, India

Correspondence e-mail: xray@iiti.ac.in

Received 3 July 2012; accepted 6 July 2012

Key indicators: single-crystal X-ray study; $T = 150$ K; mean $\sigma(\text{C}-\text{C}) = 0.004$ Å; R factor = 0.040; wR factor = 0.119; data-to-parameter ratio = 15.6.

The structure of the centrosymmetric title complex, $[\text{Cu}(\text{C}_5\text{H}_9\text{O}_2)_2(\text{C}_6\text{H}_7\text{NO})_2]$, has the Cu^{II} atom on a centre of inversion. The Cu^{II} atom is six-coordinate with a distorted octahedral geometry, defined by the N and O atoms of the chelating 2-(2-hydroxymethyl)pyridine ligands and two carboxylate O atoms from two monodentate pivalate ions. The crystal packing is stabilized by intermolecular $\text{C}-\text{H}\cdots\text{O}$ and intramolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen-bond interactions.

Bis[2-(2-hydroxymethyl)pyridine- κ^2N,O](pivalato- κO)copper(II)

M. Mobin Shaikh, Veenu Mishra, Priti Ram and Anil Birla

Comment

We have reported a series of pyridine alcohol based Cu(II) complexes with a range of applications such as biomimetic sensors (Shaikh *et al.*, 2010) and solid-state transformations (Shaikh *et al.*, 2009). Pyridine alcohols are used because they possess two functional groups, both having the ability to bind the metal centres (Hamamci *et al.*, 2004; Lah *et al.*, 2006).

Herein we report synthesis and crystal structure of a mononuclear Cu(II) complex with hmp-H acting as a bidentate chelating ligand. The Cu(II) atom is surrounded by two N and O atoms from hmp-H in a basal plane and the apical positions are occupied by two O atoms from monodentate pivalate group forming a distorted octahedral geometry (Fig. 1).

The packing reveals intra (O—H \cdots O) and inter (C—H \cdots O) hydrogen bonds. The intramolecular hydrogen bonding involves the alcoholic OH group of hmp-H and an O atom of the pivalate group (Fig. 2). The intermolecular C(4)—H(4) \cdots O(3) hydrogen bond involves an H-atom of pyridine ring and an O atom of the pivalate group forming one-dimensional chain along the b-axis which binds to a neighbouring one-dimensional chain *via* C(2)—H(2) \cdots O(3) along *c*-axis, leading to the formation of hydrogen bonded two-dimensional network (Fig. 3).

Experimental

A solution of pivalic acid (102 mg, 1.0 mmol) in 10 ml methanol was added to a 30 ml methanolic solution of Cu(CH₃COO)₂·2H₂O (199 mg, 1.0 mmol) and hmp-H (109 mg, 1.0 mmol). The resultant solution was stirred for 12 h at room temperature. The solution was then passed through filter paper (Whatman filter paper, 70 mm) in order to remove any unreacted materials. The filtrate was allowed to stand at room temperature for crystallization. On slow evaporation light-blue single crystals of [Cu(C₅H₇ON)₂(C₅H₉O₂)₂] were obtained after 2–3 d. M.p. 476–478 K. Yield: 88%. Anal. Calcd for C₂₂H₃₂CuN₂O₆ (Mr = 484.04): C, 54.59; H, 6.66; N, 5.79. Found: C 54.62; H 6.70; N 5.76.

Refinement

H atoms bonded to C were placed geometrically and treated as riding on their parent atoms, with C—H 0.95 (pyridyl), C—H 0.99 (methylene) Å [$U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ or $1.5 U_{\text{eq}}(\text{C}_{\text{methyl}})$]. The hydroxyl H atom was freely refined.

Computing details

0 restraints	$\Delta\rho_{\min} = -0.54 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
